

## Functional and logic programming

- written exam -

### **Important:**

1. Subjects are graded as follows: of - 1p; A – 1.5p; B - 2.5p; C - 2.5p; D - 2.5p.
2. Prolog problems will be resolved using SWI Prolog. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for all the predicates used; (3) specification of every predicate (parameters and their meaning, flow model, type of the predicate - deterministic/non-deterministic).
3. Lisp problems will be resolved using Common Lisp. The following are required: (1) explanation of the code and of the reasoning behind it; (2) recursive model that solves the problem, for each function used; (3) specification of every function (parameters and their meaning).

**A.** The following function definition in LISP is given

```
(DEFUN F(L)
  (COND
    ((NULL L) NIL)
    ((LISTP (CAR L)) (APPEND (F (CAR L)) (F (CDR L)) (CAR (F (CAR L)))))
    (T (LIST(CAR L)))
  )
)
```

Rewrite the definition in order to avoid the double recursive call (F (CAR L)). Do NOT redefine the function. Do NOT use SET, SETQ, SETF. Justify your answer.

**B.** Given a list composed of integer numbers and sublists of integer numbers, write a SWI-Prolog program that verifies if all the elements of the list (including those in sublists) form a symmetrical sequence. For example, for the list [1, 5, [2,4], 7, 11, 25, [11, 7, 4], 2, 5, 1] the result will be true.

**C.** Given a list composed of integer numbers, generate in PROLOG the list of arrangements of  $N$  elements ending with an odd value and have the sum  $S$  given. Write the mathematical models and flow models for the predicates used. For example, for the list  $L=[2,7,4,5,3]$ ,  $N=2$  and  $S=7 \Rightarrow [[2,5], [4,3]]$  (not necessarily in this order).

**D.** An n-ary tree is represented in Lisp as ( node subtree1 subtree2 ...). Write a Lisp function to return the list of nodes on the given level **k**. The root level is assumed zero. **A MAP function shall be used.** ***Example*** for the tree (a (b (g)) (c (d (e)) (f)))

**a)** k=2 => (g d)      **b)** k=5 => ()
